Chart-based Price Calculation
- P4 -

This module allows you to calculate prices by using the price charts.

You therefore need Module P3, which allows you to create a pricing range that consists in a set of price charts.

This CHACALXXI module allows you to calculate prices by using the price charts, just like your resellers. You can also calculate prices based on disbursements.

CHACALXXI processes multiple scenarios:

If you enter a reference that is in the library, it uses the price chart that is there. CHACALXXI is also able to calculate the price for glazing or support structures that are not those in the library.

If, however, the reference entered is not in the library, CHACALXXI attempts to react like a sales representative who provides prices. For example, it takes the price of an "OF1" and the price of a "Fixed", if it has to calculate the price of an OF1 juxtaposed to a Fixed.

It may also use the price charts called up by the nomenclatures defined to this end within CHACALXXI.
